

Soil Treatment Centre : Saint-Rosaire

318, Grande Ligne road
St-Rosaire (Quebec) G0R 1K0
Phone : 1.866.981.0191, ext. 105152

At Englobe, we dare to rethink the way we do things. We care deeply about tangible, practical change that makes the future better. We exist to help our Clients and our communities build sustainability. Every project counts. Every day.

Englobe is a leading provider of specialty environmental and engineering services, supporting infrastructure development for public and private sector Clients. We have highly experienced and specialized teams, equipment, offices, certified laboratory facilities and soil treatment centres across Canada, the United Kingdom and France. We are conveniently located in your market to support all your large and small projects from start to finish in any way we can.

Since 2014, our facilities at the St-Rosaire soil treatment center have been meeting the local needs of our clients. Englobe uses a biological treatment process developed in Quebec: the Biopile. This biotreatment process creates favorable conditions for the rapid growth of naturally occurring microorganisms, which feed on organic contaminants and degrade them into non-toxic compounds. The treatment continues until the treatment objective is reached. Once the treatment is complete, the soil is reclaimed in accordance with MELCC's Intervention Guide and applicable laws and regulations.

SERVICES

- Soil treatment and reclamation
- Soil traceability system
- Characterization of excavated soil
- Preparation of the required documents including transport manifests
- Excavation and transportation of contaminated soil
- Issuance of a decontamination certificate ducts and topsoil substitutes
- Backfill materials
